

$\ker J_{\text{combined}} = \ker(J_1 T_1) \cap \ker(J_2 T_2)$; one-station null dominated by p_{xy}

Identity/aligned transport

Transport-complementary station

Generic rotation illustration only; an actual beamline conclusion requires a measured or calculated spin-transfer map.

The combined null space is the intersection of transported station null spaces. An aligned duplicate improves counts but not rank; a complementary rotation can reduce the intersection.
